Computer vision

Name : G. Mathish
Reg no : 192421135
Course : ITA0506
Date : 11/07/2026

43/50

1)

a) Image understanding, object and recognition Scene information, Decision making

b) The real world of application is:

* Face recognition
* Driving

2) a) Feature extraction is a process of identify the important Characteristics (like edges, nodes etc...)

b) It identifies and classify the object accurate enabling, tracking.

3) a) low level image processing are basic operation like enhancement, noise removal and filtering

b) mid level image processing are detection image segmentation, high level image processing are ~~objects~~ recognition, understanding image.

4) a) Pixel is a small unit ~~of~~ digital images, and used to be adjustment of color

b) The High ~~quality~~ resolution image take a more resolution the image come clearly and quality

5) a) The image sensor use to analyse the image automatically

b) webcam, CCTV

6) a) The sample are ~~converts~~ into a continous images into discrete ~~image~~ pixels.

b) Quantization assign intensity convert the analog values into digital numbers.

7) a) Perspective projection is the process of projection scene 3D onto a 2D image

b) Illumination provide light that determines the brightness color and visibility.

~~ado~~ processing is the technique of ehnacing image using a computer algorithm

b) Image Processing | Computer vision

Enhances image or modify | understanding image content

improved image | information or decision

9) a) The ~~compter~~ ~~vision~~ vision it help a doctor to take x-ray, MRI and diagonais

b) The computer vision take a road traffic vehicals

10) a) Every digital image made of pixels each color storing and informations

b) High resouling provides a quality image more detail improving the information
