

1)

a) Image understanding, object and recognition
Scene information, Decision making

b) The real world application is:

- * Face recognition

- * Driving

2)

a) Feature extraction is a process of identify the important characteristics (like edges, nodes etc...)

b) It identifies and classify the object accurately enabling tracking.

3) a) Low level image processing are basic operation like enhancement, noise removal and filtering

b) mid level image processing are detection image segmentation,

high level image processing are object recognition, understanding image.

- 4) a) Pixel is a small unit of ^{digital} images, and used to be adjustment of color
b) The High ^{resolution} ~~quality~~ image take a more resolution the image come clearly and quality
- 5) a) The image sensor use to analyse the image automatically
b) webcam, CCTV
- 6) a) The sample are ~~converted~~ into a continuous images into discrete ~~image~~ pixels.
b) Quantization assign intensity convert the analog values into digital numbers.
- 7) a) perspective projection is the process of projection scene 3D onto a 2D image
b) Illumination provide light that determines the brightness color and visibility.

8) a) Image processing is the technique of enhancing image using a computer algorithm

b) Image Processing Computer Vision
Enhance image or modify content
improved image information or decision

9) a) The computer vision it help a doctor to take x-ray, MRI and diagnosis
b) The computer vision take a road traffic vehicles

10) a) Every digital image made of pixels each color storing and informations

b) High resolution provides a quality image more detail improving the information
